THE ONLY TRUE WHOLE BODY CRYOTHERAPY

Conclusions of the head-to-head study comparing ***Whole Body Cryotherapy*** (WBC - Electric walk-in chambers at -166°F) to ***Partial Body Cooling*** (PBC - Nitrogen saunas a -256°F) were that skin temperature drops in all regions of the body *were far more significant in the WBC group*. Skin temperature drops are associated with the activation of the Central Nervous System (CNS) and Autonomic Nervous Systems (ANS) causing the release of Anti-inflammatory modulating proteins (norepinepherine) as well as pain modulating endorphines. WBC showed a significantly high (+35%) plasma norepinepherine concentration compared to PBC.
